52 eDiscovery Terms That You Should Know

A

Admissible: Evidence that is allowable in court

Analytics: The term used to refer to the various technologies used to provide multiple views into the data set

Archive: Long term repository for the storage of records and files

Attachment: A document or file that is connected to another document or file either externally, e.g. a document connected to an email, or embedded, e.g. an image in a word processing document.

Attachment Backup: Both the action of and the result of creating a copy of data as a precaution against the loss or damage of the original data.

B

Backup tape: Portable media used to store copies of data that are created as a precaution against the loss or damage of the original data

Batch Processing: The processing of a large amount of ESI in a single step

C

Chain-of-Custody: The processing, tracking and recording the movement, handling and location of electronic evidence chronologically from collection to production. It is used to verify the authenticity of the ESI.

Child Document: A file that is attached to another communication file. E.g. the attachment to an email or a spreadsheet imbedded in a word processing document

Container File: A single file containing multiple documents and/or files, usually in a compressed format; e.g. zip, rar, pst

Custodian: Most often refers to the individual from whose file systems a group of records were extracted. This person is not necessarily the author of the documents.

D

Data Extraction: The process of parsing data from electronic documents to identify their metadata and body contents

Data Mapping: The process of identifying and recording the location and types of ESI within an organization's network, and policies and procedures related to that ESI

De-duplication: De-duping. The process of comparing the characteristics of electronic documents to identify and/or remove duplicate records to reduce review time and increase coding consistency

De-NIST: The process of separating documents generated by a computer system from those created by a user. This automated process utilized a list of file extensions developed by the National Institute of Standards and Technology.

Discovery: The process of identifying, securing, reviewing information that is potentially relevant to the matter and producing information that can be utilized as evidence in the legal process

Document Family: All parts of a group of documents that are connected to each other for purposes of communication; e.g. an email and its attachments

E

e-Disclosure: The eDiscovery process as it is practiced in the European Union

Electronic discovery: ediscovery, e-discovery. The process of identifying, preserving, collection, preparing, reviewing and producing ESI in the context of a legal or investigative process

Electronic evidence: Information that is stored in an electronic format. This is used to prove or disprove the facts of a legal matter.

Email: An electronic communication sent or received via a data application designed for that purpose (e.g. MS Outlook, Lotus Notes, Google Gmail)

ESI: Electronically stored information

F

Filtering: The process of applying specific parameters to remove groups of documents that do not fit those parameters, in order to reduce the volume of the data set, e.g. date ranges and keywords

Forensics: The handling of ESI including collection, examination and analysis, in a manner that ensures its authenticity, so as to provide for its admission as evidence in a court of law

FRCP: Federal Rules of Civil Procedure, the rules that govern ediscovery and other aspects of the civil legal process.

H

Hash: An algorithm that generates a unique value for each document. It is referred to as a digital fingerprint and is used to authenticate documents and to identify duplicate documents.

I

Image (Drive): To make an identical copy of a drive including its empty space. "mirror image"

Image (File): To make a picture copy of a document. The most common image formats in ediscovery are tiff and pdf.

L

Legacy Data: Data whose format has become obsolete.

Legal Hold: A communication requesting the preservation of information that is potentially relevant to current or a reasonably anticipated legal matter and the resulting preservation.

Load File: A file used to import data into an ediscovery system. It defines document parameters for imaged documents and often contains metadata for all ESI it relates to.

M

Media: The device used to store electronic information, e.g. hard drives, back up tapes, DVDs

Metadata: Often referred to as data about data, it is the information that describes the characteristics of ESI, e.g. sender, recipient, author, date. Much of the metadata is not accessible to non-technical users.

N

Native Format: A file that is maintained in the format in which it was created. This format preserves metadata and details about the data that might be lost when the documents are converted to image format, e.g. pivot tables in spreadsheets.

Near-duplicate: Two or more files that contain a specified percentage of similarity. Also, the process used to identify those nearly-identical files

Normalization: Reformatting data so that it is stored in a standardized format

O

OCR: Optical Character Recognition is the process of converting images of printed pages into electronic text

P

Parent Document: A document to which other documents/files are attached

Predictive Coding: A document categorization process that extrapolates the tagging decisions of an expert reviewer across a data set. It is an iterative process that increases accuracy with multiple training passes.

Precision: In search results analysis, precision is the measure of the level of relevance to the query in the results set of documents. *See Recall*

Processing: The ediscovery workflow which ingests data, extracts text and metadata, and normalizes the data. Some systems include the data indexing and de-duplication in their processing workflow.

Production: The delivery, to the requesting party, of documents and ESI that meet the criteria of the discovery request

R

Recall: In search results analysis, recall is the measure of the percentage of total number of relevant documents in the corpus returned in the results set. *See Precision*

Redact: To intentionally conceal, usually via an overlay, portions of a document considered privileged, proprietary or confidential

S

Search: The process of looking within a data set using specific criteria (a query). There are several types of search ranging from simple keyword to concept searches that identify documents related to the query even when the query term is not present in the document.

Slack space: The unused portion of a disk that exists when the data does not completely fill the space allotted for it. This space can be examined for otherwise unavailable data.

Spoliation: The destruction or alteration of data that might be relevant to a legal matter

Structured data: Data stored in a structured format such as a database. Structured data can create challenges in ediscovery. *See Unstructured data*

T

TIFF: Tagged Image Format is a common graphic file format. The file extension related to this format is .tif.

U

Unallocated space: Most often, this is space created on a hard drive when a file is marked for deletion. This space is no longer allocated to a specific file. Until it is overwritten, it still contains the previous data and can often be retrieved.

Unicode: The code standard that provides for uniform representation of character sets for all languages. It is also referred to as double-byte language.

Unstructured data: Data that is not stored in a structured format such as word processing documents and presentations

Peace of Mind for Serious eDiscovery™

eDiscovery is a critical part of your case. From proactive litigation-readiness to managed review, the process must be fast, efficient, and focused on reducing costs. Choosing the right partner to ensure a strategic and defensible approach gives you the first advantage. Having experts manage that course of action puts you one step ahead from start to finish.

CDS is the first choice of more than 75% of Am Law 100 firms.

CDS uses the most advanced, analytic technology available. Our hands-on experts personally shepherd your evidence through time-tested processes to provide clear strategies and superior outcomes. From accessible project managers, who you know by name, to our SAS 70 Type II audited, secure data centers, everything we do is about providing you with unmatched peace of mind.

One quarter of the Fortune 500 partners with CDS.

"Early strategies are critical to the success and path of work. Then those strategies need to be executed flawlessly. CDS is our first choice for reliable, defensible eDiscovery."

— PARTNER, AM LAW 100 FIRM

Litigation Readiness

eDiscovery requirements are changing fast. Companies and law firms must be prepared for today's complex discovery requests while anticipating what's next. CDS partners with legal teams to establish proactive information management through better data retention and destruction policies. Shrinking data volumes before a complaint is filed makes you faster out of the gate, reduces costs, and offers you better command of even the most demanding discovery requests.

Early Case Assessment

eM@S, CDS' proprietary data analysis system, indexes documents at lightning speed, so you can start evaluating data before most other systems have finished ingesting. Multi-threading and our distributive architecture allow your CDS team to analyze multiple data sources simultaneously. Detailed reports, de-duplication, and extensive filtering tools mean that the dataset can be drastically reduced prior to processing. eM@S delivers time and cost savings that are just one part of the ECA process.

Processing and Production

eDiscovery that is fast, efficient, and defensible allows your litigation team to focus on more manageable volumes of meaningful evidence. Our project managers and engineers use best-in-breed hardware and software to expertly guide your evidence through the process. Size does not matter. We can scale our services from a single CD to terabytes of ESI.

Time has direct implications on eDiscovery cost and resources. CDS offers unmatched processing speeds at competitive prices. Our capacity and dedication turn most projects around in the time that it takes the competition to get started.

- High-speed multi-thread processing
- Real-time reporting
- De-duplication
- Full redaction tools
- Native and image file production
- Concordance or EDRM compliant XML load files
- Integrated production services

Peace of Mind for Serious eDiscovery™

Review Hosting and Managed Review

If you're working around the clock, so are we. We support our highly secure SAS 70 Type II data centers 24/7. And rest assured that we employ the most advanced technologies and protocols to protect sensitive data from damage by malice, accident or error.

CDS partners with the industry's leading review tool developers and contract review staff to meet your case's specific needs. For complex projects, our experienced PMs and Director of eDiscovery Strategy work with case teams to tailor work-flows—from reviewer training to trial preparation.

CDS' National Data Center is SAS 70 Type II audited. Our three locations are available 24/7.

Global Coverage and Trans-border eDiscovery/eDisclosure

The world is getting smaller, but the demands of global electronic discovery are growing. Multi-national corporations involved in U.S. litigation can be required to collect data that is subject to EU directives. CDS' international eDisclosure program merges EU-based eDisclosure specialists with our proven U.S. based eDiscovery firm, to seamlessly carry you through the process. And CDS' Safe Harbor certification ensures that data which reaches the U.S. remains compliant with EU privacy regulations. From collection to production, our solutions are ready for your overseas needs.

Our Unicode-compliant technology provides multi-lingual capabilities. It automatically identifies the languages within documents and provides detailed reports. Reviewers can search documents in Roman, Asian, and Cyrillic languages.
